DETAILED ACTION
EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Joseph Buczynski on 01/29/2009.

The application has been amended as follows:

Abstract (amended):

An object of the invention is to provide an optical disc in which the influence of recording interference is reduced to make it possible to narrow the interval between adjacent recording tracks and increase the recording density of information. The optical disc comprises a substrate 4 on which the grooves **G** are formed, a reflecting layer 2 for reflecting an optical beam, a recording layer 3, and a cover layer 5 for protecting the recording layer 3, in which the cover layer 5, the recording layer 3, the reflecting layer 2 and the substrate 4 are disposed in this order from the side where the optical beam is applied, and the thickness of the recording layer 3 formed in an area opposed to the groove **G** and forming a recording track **TR** is greater than the thickness of the recording layer 3 formed in an area opposed to an area on the substrate 4 between two adjacent grooves **G**.

REASONS FOR ALLOWANCE

Claims 1-4 are allowed.

The following is an examiner's statement of reasons for allowance: The present invention is directed to an information recording medium which comprising a substrate, a recording area, a cover layer.

The following is a statement of reasons for the indication of allowable subject matter: The independent claims 1, and 4 are identifies the uniquely distinct feature for "wherein said cover layer, said recording layer and said substrate are disposed in this order from the said where said optical beam is applied; and

Wherein the thickness of said recording layer formed in an area opposed to said groove and forming a recording track on which the information is recorded is greater than the thickness of said recording layer formed in an area opposed to an area between said two adjacent grooves on said substrate"

Hamada et al., JP 06-282871, discloses to provide an optical information recording medium which reduces jitter and the unbalancing of pit size as much as possible. A light transmission substrate 12 is provided at one surface side of a light absorption layer containing an organic coloring matter, a reflection layer 18 is provided at the other surface side of the light absorption layer 14 via an enhancement layer, a guide groove is formed on the surface at the side of the light absorption layer 14 of the light transmission substrate 12, the light absorption layer at the guide groove part is

thicker than the light absorption layer 14 of the land part outside the guide groove, and then enhancement layer covering the light absorption layer 14 of the guide groove part of the above light transmission substrate 12 is thicker than the enhancement layer 16 covering the light absorption layer of the land part outside the guide groove.

Kikuchi Minoru, JP 2002-008269, discloses to manufacture an optical recording medium which prevents intrusion of air bubbles into an adhesive resin between the substrate and the light-transmitting layer, which improves the production yield, which can deal with a higher NA of an objective lens and which has a light-transmitting layer of uniform film thickness having small double refraction and high transparency. The light-transmitting layer 6 on the disk substrate 1 consists of a *light-transmitting* sheet 2 and an UV-curing resin layer 3a to adhere the light-transmitting sheet 2 to one principal face of the disk substrate 1. The layer constituting the outermost layer of the information signal part 1c consists of a material having such properties that, when the film is left to stand in air for about 5 hours after the film is formed and taken out into air, the contact angle of the film with water is smaller than twice of the contact angle with water of the film directly after taken out into air. The material which constitutes the outermost layer of the information signal part 1c is preferably a nitride specifically Si₃, TiN, TaN or AlN.

None of the prior art, either singularly or in combination, fails to anticipate or render the above underlined limitations obvious. Claims 2-3 are dependent on claim 1 and therefore dependent claims also allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
